

Project Overview

The project is a **web scraping and data warehousing platform for Egyptian news websites**. It automatically collects news articles from multiple Egyptian news sources, stores and organizes the collected data in a centralized **Data Warehouse**, and enables analytical reporting to identify trends and generate useful KPIs about news coverage across different sources.

Objectives

- Collect news articles from multiple Egyptian news websites automatically.
- Centralize news data from different sources in a single Data Warehouse.
- Track and compare how different news websites cover the same or similar stories.
- Track important information such as publication dates and news sources.
- Generate useful KPIs and analytical insights from the collected data.
- Build an automated and scalable data pipeline for continuous data collection and processing.

Project Scope

The project covers:

- **Web Scraping:** Extracting news data from selected Egyptian news websites.
- **Data Processing:** Cleaning, transforming, and standardizing the collected data.
- **Data Warehouse:** Storing historical and structured news data in a centralized warehouse.
- **Data Integration:** Combining data from multiple news sources.
- **Analytics & KPIs:** Analyzing news coverage across sources, such as the number of websites publishing the same story and differences in publication dates.
- **Automation:** Running the scraping and data pipelines periodically to keep the warehouse updated.
